

# Palo Alto Networks™ Remote Installation Services

Get professional installation for the Palo Alto Networks next-generation firewall with assistance from an experienced engineer. Remote Installation Services helps customers get projects set up quickly and installed properly for smooth deployment.

Staff network engineers are busy with many tasks, such as handling architectural decisions and maintaining the environment to meet the needs of the business. They may not have the time, however, to get training on how to install new systems. Installation is a critical, time-sensitive event where experience and expertise are essential for success. For professional assistance to get a new project off to a great start, Palo Alto Networks offers Remote Installation Services.

Remote Installation Services is a program that provides customers with skilled engineers who will provide assistance for a smooth, rapid roll out of the next-generation firewall. Using a proven methodology for preparation, deployment, and configuration, the Remote Installation Services engineer ensures that every step of the installation is done correctly and tested along the way. The Remote Installation Services engineer will meet with customer staff over the phone and via the web for clear lines of communication to ensure success.

In addition to getting critical assistance with setting up Palo Alto Networks next-generation firewall, the Remote Installation Services engineer works with the customer to provide knowledge transfer on the installation and the key product features.
